The present invention relates to recombinant human proteolytic tryptases, active site mutants of these tryptases and the methods for producing these. The method involves the production of a DNA expression construct comprising a promoter operably linked to a secretion signal sequence which is operably linked to a DNA sequence encoding a proteolytic tryptase with an active site mutation (the construct drives expression of a mature proteolytic tryptase that lacks engymatic activity due to the active site mutation, in hosts transformed to contain the construct). The method is useful for producing enzymatically-active beta-II tryptase. The active site mutants of proteolytic tryptase provide a tool to investigate the structural and functional properties of the protease and its enzymatic activity, and for modelling studies. The enzymatically-active, recombinant proteolytic tryptase produced are useful as an antigen to

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This nucleotide sequence includes a coding region for human mast cell tryptase II/beta (see AAW64240). The invention provides: compositions comprising an isolated tryptase-7 that may include chimeric proteins that contain (a) a human tryptase for all but the active site region and (b) the substrate-binding pocket of mouse tryptase-7 or its homologues (see AAW64233-39); a method for treating a blood clot by administering a nucleic acid molecule that codes for a tryptase-7, or an expression product, to decrease fibrinogen activity; a nucleic acid encoding a serine protease (SP); and a method of producing a mature SP by expressing the inactive zymagen in a host cell, and cleaving the enteroxinase susceptibility domain. The tryptase-7 polypeptides can be used to treat disorders mediated by undesirable thrombus clot formation such as converted at interaction and reocclusion following angioplasty of blood clots associated with pulmonary thromboembolism, deep vein thrombosis, cerebral embolism, renal vein and peripheral arterial thrombosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        146

P-PSDB; AAW63175

This cDNA encodes the human mast cell tryptase II/beta which is a homologue of the mouse mast cell protease (mMCP-6) zymogen. The invention provides sequences shown in AAM63160 to AAM63169 that are inhibitors of mMCP-6. These peptides which are tryptase-6 complex inhibitors, can be used for treating a mast cell-mediated inflammatory disorder. The inhibitors can be used to treat inflammatory disorders including asthma, allergic rhinitis, urticaria and antioedema, eczematous dermatitis (atopic dermatitis), anaphylaxis, hyperproliferative skin disease, pepticulors, inflammatory bowel disorder, hyperresponsiveness and inflammatory Tryptase-6 complex inhibitory peptides - used to treat mast cell-mediated inflammatory disorders e.g. asthma. /note="Organ: Bye; Vector: pCMVSPORT6; A human iris
library (bx) was normalized by self-subtraction. One
portion of double stranded plasmid DNA representing the
library was linearized by NotI. This NotI digested library
was used as a template for biotinylated RNA synthesis
using SP6 RNA polymerase. Another portion of the double
stranded plasmid library was converted to single-stranded
circles in vitro using Gene II and Exonuclases III (Life
Technologies). Single-stranded DNA (1 mg) was hybridized
(CD 500) with 41 mg of Bio-RNA and vector blocking
oligonucleotides. The hybridized Bio-RNA/Ss-circles were
removed by streptavidin:phenol extraction. EST analysis
was performed on the library at the NIH Intramural
                                                                                                                                                                                                                           1 (bases 1 to 619)

/clone lib="Human Iris cDNA (Normalized): fg"
/clone lib="Human Iris cDNA (Normalized): fg"
/note="Organ: Bye; Vector: pCMVSPORT6; A human iris
library (Dx) was normalized by self-subtraction. One
portion of double stranded plasmid DNA representing the
library was linearized by Not! This Not! digested library
was used as a template for biotinylated RNA synthesis
using SP6 RNA polymerase. Another portion of the double
stranded plasmid library was converted to single-stranded
circles in vitro using Gene II and Exonuclease III (Life
Technologies). Single-stranded DNA (1 mg) was hybridized
(CUt 500) with 41 mg of Bio-RNA and vector blocking
oligonuclectides. The hybridized Bio-RNA/se-circles were
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              cesteaacetriccaeccacerccacercacetreccieccccreccreaeaeacctrice 454

Expressed sequence tag analysis of adult human iris for the NEIBank
Project: steroid-response factors and similarities with retinal
pigment epithelium
stranded plasmid library was converted to single-stranded circles in vitro using Gene II and Exomuclass III (Life Technologies). Single-stranded DNA (1 mg) was hybridized (C0t 500) with 41 mg of Bio-RNA and vector blocking oligonucleotides. The hybridized Bio-RNA se-circles were removed by streptavidin:phenol extraction. EST analysis was performed on the library at the NIH Intramural
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              136

I site by treatment of T4 RNA ligase and the first strand cDNA was synthesized from oligo dT-selected mRNA by priming with dT-tailed vector. The dT-tailed vector was adjusted to have about 60nt. The cDNA vector was circularized with E. coli DNA ligase after digestion of EcoRI which site is also included in vector. An RNA strand converted to a DNA strand by Okayama-Berg method. The
